

Yaupon Holly

Scientific Name: Ilex vomitoria

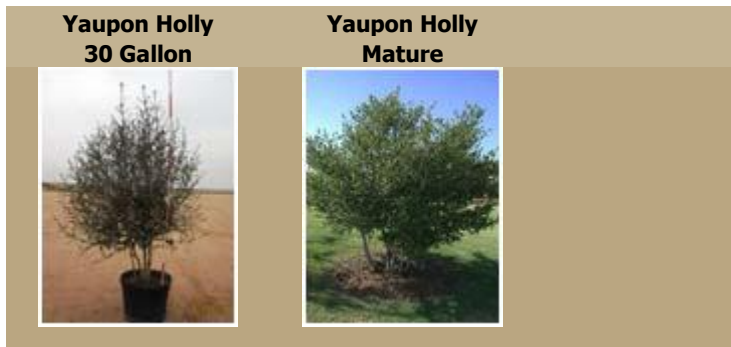

The **Yaupon Holly** is native to Texas and is adapted to a variety of soil types with its superior level of shade and drought tolerance. The Yaupon Holly can be trimmed into a dense hedge or the Yaupon Holly can be pruned into a small tree revealing its uniquely contorted trunks. The Yaupon Holly has a densely rounded canopy filled with simple, leathery, dark green leaves. Yaupon Holly leaves are oval shaped, about 1/2 inch long and have serrated edges. The Yaupon Holly produces inconspicuous white flowers in the spring. The flowers allow the Yaupon Holly to pollinate and produce an abundant amount of vivid red berries that are very attractive. The bark on a Yaupon Holly is smooth with a dark gray color.

Ilex vomitoria

Aquifoliaceae

Yaupon is probably the most versatile evergreen holly for general use in Texas. It grows on almost any soil type and in sun or shade, although it is found naturally in low, moist, acid woods. It is drought tolerant but can also survive temporary poor drainage. In the wild it is a thicket-forming large shrub or small tree. In landscapes it can be single- or multi-trunked; it has attractive pale white to gray bark. The fruits that appear in late summer and fall are very ornamental, generally red but sometimes yellow to orange, and are eaten by many birds, especially after freeze-thaw cycles.

Plant Habit or Use: medium shrub large shrub small tree

Exposure: sun partial sun

Flower Color: light green, inconspicuous

Blooming Period: spring

Fruit Characteristics: Glossy red, orange, or pale yellow berry-like drupe

Height: Typically 10 to 20 ft., but individuals can range from 4 to 30 ft.

Width: 8 to 12 ft.

Plant Character: evergreen

Heat Tolerance: very high high

Water Requirements: high medium low

Soil Requirements: adaptable
